

## K-MAG® Leno Heald Control

**The leno heald control allows the use of the K-MAG® leno heald with its typical advantages for modern weaving technology even in the field of Jacquard weaving.**

**The sophisticated design is characterized by**

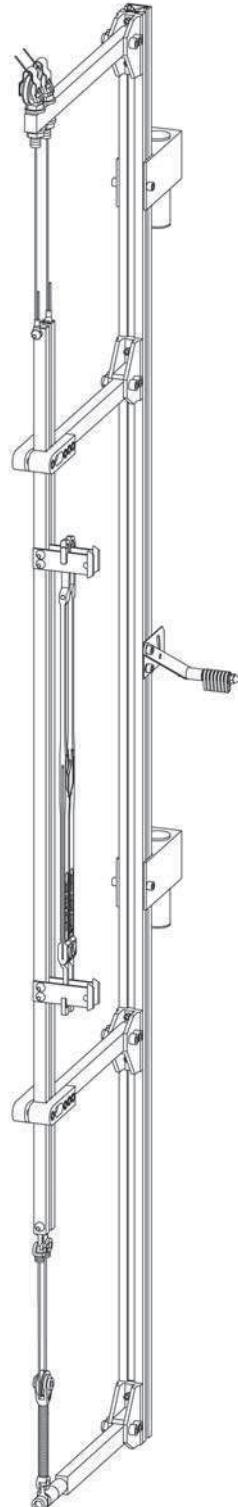

- the reliable, solid Jacquard support device made out of light metal in order to reduce weight
- the possibility of a direct drive from the Jacquard machine (knife box) or alternative control by the sinker or – depending on the requirements – by means of the shedding motion
- light metal square tube for a safe positionning
- smooth thread guiding pulleys with unthreading protection
- long and short spacing pieces for different fields of application
- a user-friendly installation of the leno heald on special heald carriers
- the great number of available adaptors for the quick installation of the K-MAG® leno heald control to all current Jacquard weaving machines
- an integrated holding-down device with ceramic thread guide
- a very good price-performance ratio
- the reliable selvedge binding up to a speed of 700 picks per minute

The use of the typical two-end leno heald binding in the field of Jacquard weaving reduces the cost of fabric production while assuring safe and flat selvedges. Furthermore, additional leno healds may be mounted on to the heald carriers, if necessary.

**To guarantee a trouble-free function of the K-MAG® leno heald control, indispensable components are**

- the Klöcker cross leno cone creels with variable fastening adaptors for two up to six bobbins and
- the Klöcker thread reversions with universal adaptors for two up to six threads.

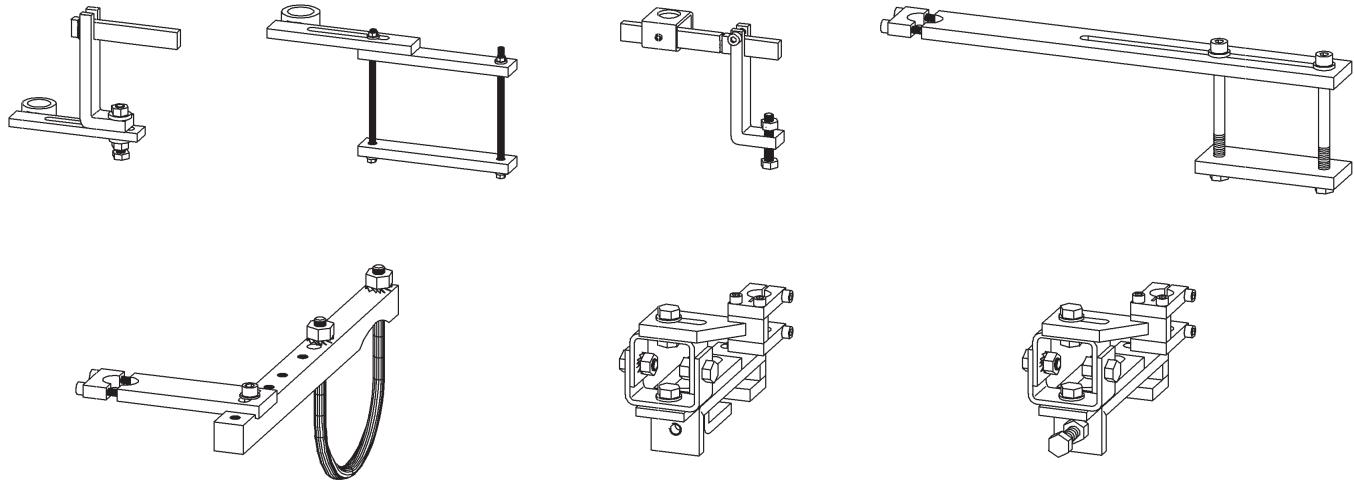

They make up the Klöcker functional unit.

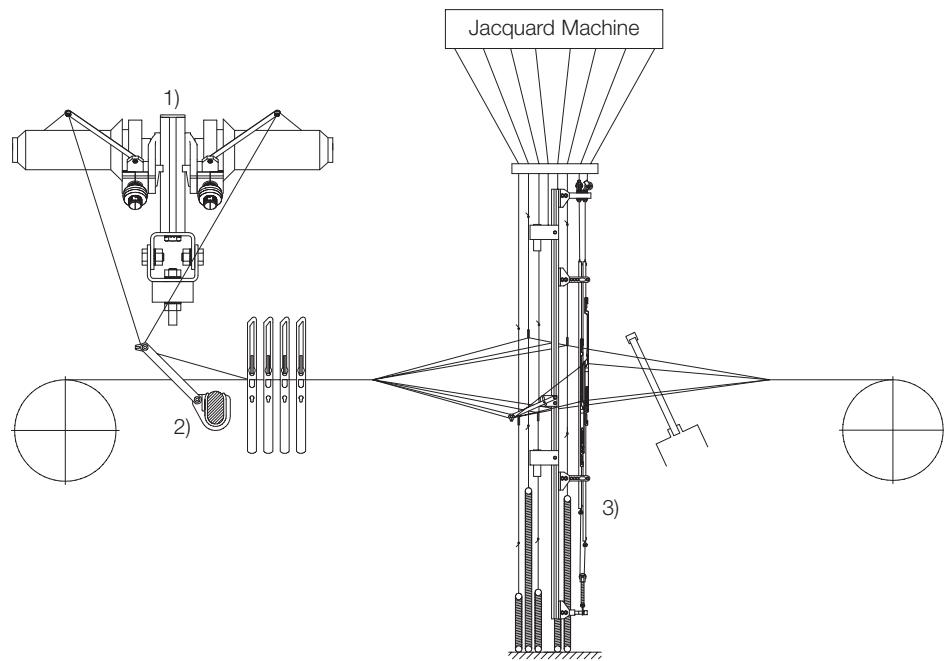

**K-MAG® Leno Heald Control**

Modern Jacquard weaving with the K-MAG® leno heald control requires various possibilities of fastening due to the variety of weaving methods and customers' specifications. The high quality Klöcker Jacquard adaptors are available for all current Jacquard weaving machines, can be installed quickly and easily and offer the appropriate solution and alternative for every application to meet the necessary flexibility demanded in modern weaving.
